

CvarcLogger — What's New

Covering versions 2.06 through 2.08

It's been a few releases since the last summary, so here's everything worth knowing: a full suite of contest scoring tools, SKCC (Straight Key Century Club) support, better Cabrillo import/export, improved awards tracking, and a batch of smaller day-to-day usability fixes.

Contest Scoring, All in One Place

The biggest addition across these releases is a full Contests menu — open it from the sidebar's Awards/Contests button (click it a second time). Each contest gets its own scoring window: enter a few details, click Recalculate, and see a full breakdown.

- **Field Day:** Score by power class (QRP/Low/High) with QSO points broken out by Phone/CW/Digital, bonus points (Emergency Power, GOTA Bonus, GOTA Coach, and more), and a full ARRL section/state list.
- **ARRL Sweepstakes:** Separate CW and Phone events, scored automatically for the correct contest weekend, with a button to backfill missing ARRL sections on older QSOs.
- **CQ WW DX Contest:** Separate SSB and CW events across all bands, following the official same-country/same-continent/different-continent scoring rules.
- **Sprints:** CW/SSB/RTTY Sprints plus the ARRL VHF Contest, with manual date/time entry since Sprint dates don't follow a fixed weekend-of-month pattern.
- **NAQP:** CW/SSB/RTTY North American QSO Party, both events of the year, from a single year field.
- **SKCC:** New in 2.08 — scores the Weekday Sprint, Weekend Sprintathon, Europe Sprint, Asia Sprint, and QSO Party using SKCC's own published rules, not a guess. Automatically works out your QSO points, multipliers, and bonus points for every Centurion, Tribune, and Senator you contacted, plus event bonuses like the special club station or unique grid squares.

Field Day, Sweepstakes, CQ WW, Sprints, and NAQP are all labeled “Beta” in the app while they're verified against real contest logs. A couple of bugs turned up and were fixed along the way — notably a crash opening the Field Day scorer, and Field Day's Emergency Power bonus was corrected to award points per transmitter instead of a flat amount.

SKCC: Look Up Members and See Their Status Live

Alongside the SKCC scorer, three new ways to find and confirm a station's SKCC number:

- **Editing a QSO:** A new “Lookup” button next to the SKCC # field checks the station's callsign against the SKCC roster and fills in their number.
- **Bulk Edit:** Select several QSOs and click “Lookup SKCC # for Selected” — each QSO's own callsign is looked up individually, so a mix of members and non-members is handled correctly.
- **While logging:** If you didn't type in an SKCC number yourself, the program checks automatically when you log the QSO.

The entry form also shows a colored tier badge (gold/silver/bronze for Senator/Tribune/Centurion) next to the SKCC # field, and a live “exchange preview” line — callsign, RST, state, name, and SKCC # — so you can double-check what you've copied before logging.

Cabrillo Import & Export

- Full Cabrillo v3 read/write support added, including the contest header (callsign, category, address, operators, soapbox, etc.), which is now remembered between exports so you don't retype it every time.
 - Importing a Cabrillo log now routes each received exchange into the right field automatically — serial numbers, states, ARRL sections, and Field Day-style class/state pairs are all recognized instead of dropped.
 - Large contest log files import faster and use less memory.
-

Awards & Activation Tracking

- SOTA and POTA detail panels now show full activation history — callsigns, dates, QSO counts, and location details — not just a summary number.
 - Mountain Goat award now correctly requires all 1,000 activator points within the same calendar year, rather than counting them over your whole activation history.
 - The DXCC entity list grew from 338 to 402 entities, now including CQ/ITU zone data and deleted (retired) entities, so more DXCC lookups resolve correctly.
-

Radio Control & WSJT-X

- CvarcLogger can now receive logged QSOs directly from WSJT-X's own multicast broadcast, as an alternative to relaying through GridTracker2 — a simple checkbox switches between the two.
 - CAT Control's Internet Control mode now supports multiple radio types (Elecraft K4, FlexRadio, Icom CI-V, Kenwood TS) over a network connection, not just one.
 - The USB CAT connection test now actually polls the radio, instead of just checking whether the software's own listener is running — so a false “connected” no longer shows when the radio is unplugged or on the wrong port.
 - “Launch automatically” for USB CAT control is now on by default, so it works out of the box without extra setup.
-

Everyday Usability

- Pressing Tab after typing a callsign now triggers an automatic lookup, same as clicking the Lookup button.
 - The entry form and log grid can now be resized against each other with a draggable divider, so you can give more room to whichever one you're using.
 - A full in-app Help window was added with the complete user manual, including tables, and a search box that jumps to and highlights matches.
 - The installer now lets you pick a custom install location, and uninstalling asks whether to keep or remove your log database.
-
